Installing Digioh JavaScript on your Site

Last Modified on 06/24/2026 11:24 am EDT

To install Digioh on your site as a pasted HTML snippet, follow the steps below. Alternatively, you can install via Google Tag Manager, Tealium iQ, Wordpress, or Shopify. If you make any changes to your website or migrate to a new platform, be sure to verify that your Digioh JavaScript is still present and running. If it is not, your Digioh campaigns will stop functioning and data collection will be interrupted until the script is restored.

Step 1

In Digioh, click your name in the upper-right corner. From the dropdown menu, click Setup Instructions. On the next page, choose your desired JS snippet option, and copy the code snippet.

Step 2

Open your site's "template" or "wrapper" HTML file and paste the code. See additional instructions on the Setup page. The JS Snippet should be placed as high in your site's <head> tag as possible to ensure Digioh loads as quickly as possible.

Step 3

Save the changes you made to your file. Your Digioh campaign is now installed on your site. You can test this by creating a simple campaign and add a single Condition: **URL Contains DIGIOH_TEST** (or something that will never appear in a real URL on your site). Click Publish, then go to https://www.yoursite.com/?DIGIOH_TEST and you should see the campaign appear immediately.
