# Custom JS Versioning and Undo

Last Modified on 06/25/2026 9:25 am EDT

In addition to global version control for your whole account via the More menu, Digioh stores the version history for your Custom JS code: Custom JS Campaigns, Parent, and Global. You can roll back and restore individual JS snippets, as opposed to your whole account.

Every time you save Custom JS, we check for a "diff" vs. the currently published version and create a new version if we detect changes. This prevents the creation of unnecessary versions, which also streamlines the version instance delineation anytime you do a rollback.

There is a green "success bubble" message after performing a restore from the version history which includes a "click here to undo" link. Click this link to undo the restoration, and it will be as if it had never happened.

Doing a restore does not publish. You must publish after restoring.
