## Digioh JavaScript API

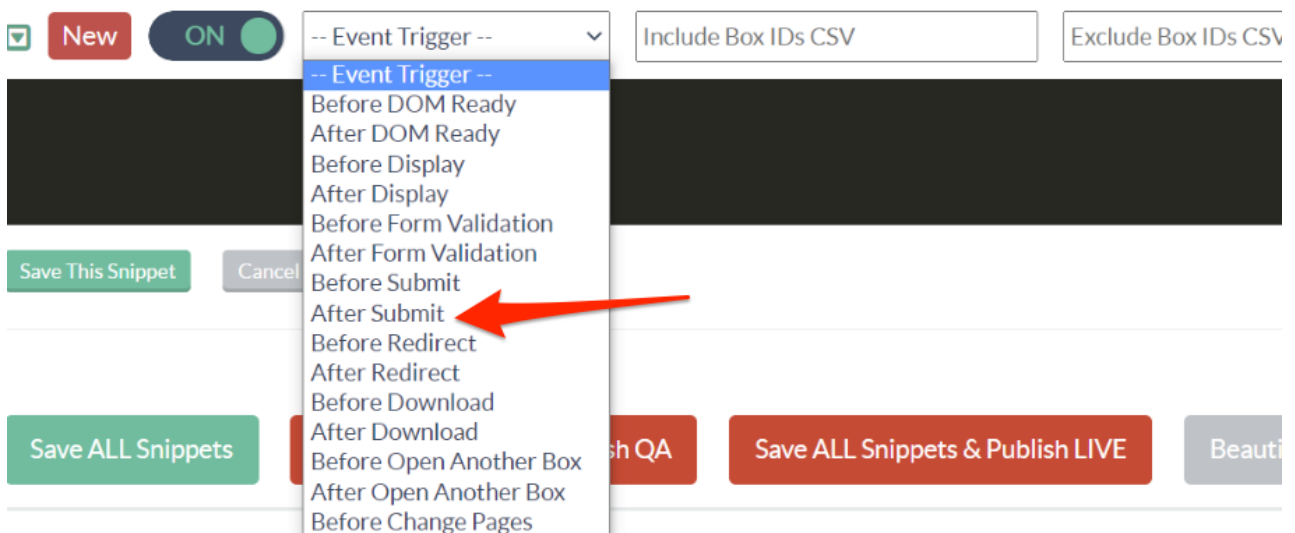

Send data to your system via JavaScript running on the customer-side:

1. In your Digioh account, go to "Custom JS (Boxes)" section, and create a new snippet:

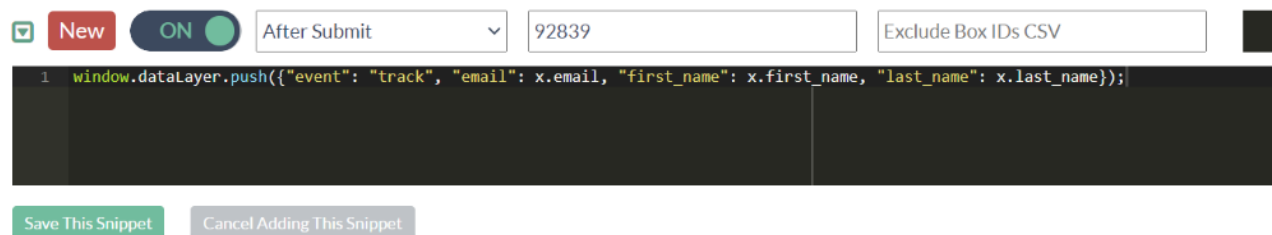

The screenshot shows the Digioh Custom JS (Boxes) interface. At the top, there is a "New" button, a toggle switch labeled "ON", and a dropdown menu currently set to "-- Event Trigger --". To the right are two input fields: "Include Box IDs CSV" and "Exclude Box IDs CSV". Below these is a large black text area for the snippet code. At the bottom, there are two buttons: "Save This Snippet" and "Cancel Adding This Snippet".

2. Choose the Digioh event trigger. Typically, this is "After Submit" for any events you want to send to your custom system:

The screenshot shows the Digioh Custom JS (Boxes) interface with the event trigger dropdown menu open. The menu lists various event triggers: "-- Event Trigger --", "Before DOM Ready", "After DOM Ready", "Before Display", "After Display", "Before Form Validation", "After Form Validation", "Before Submit", "After Submit", "Before Redirect", "After Redirect", "Before Download", "After Download", "Before Open Another Box", "After Open Another Box", and "Before Change Pages". A red arrow points to the "After Submit" option. The background shows the same interface as the previous screenshot, but with the dropdown menu open.

3. Enter your custom JS tracking code into the snippet. Typically, this would tie into an existing JS library that is already loaded on your website, such as Google Analytics. Remember, this will run on your live website, so Digioh customer-side JS will be able to send JS data to any systems also running on your site at the time. This is a common use case for many customers.

The screenshot shows the Digioh Custom JS (Boxes) interface with the event trigger set to "After Submit". The "Include Box IDs CSV" field contains the value "92839". The "Exclude Box IDs CSV" field is empty. Below these is a large black text area for the snippet code. The code is: 

```
1 window.dataLayer.push({"event": "track", "email": x.email, "first_name": x.first_name, "last_name": x.last_name});
```

 At the bottom, there are two buttons: "Save This Snippet" and "Cancel Adding This Snippet".

**Important:** if you are writing in Custom JS Campaigns, those run in iFrames, so you need to call `window.parent.dataLayer`, or `window.parent.fbq`, for example.
