

# How To Add Email Syntax Validation To A Custom Field

Last Modified on 06/10/2026 11:02 pm EDT

Email syntax validation requires the user to enter a correctly-formatted email address for their submission to go through. The address must be formatted as "name@domain.com".

**NOTE:** The standard email field has email syntax validation applied to it by default. It checks for a string that has @ and ends in a domain.

If you use a custom field for the Email field instead of our default field, you can add email syntax validation from the editor. First, select the custom field from the Fields dropdown. Then, set the Validation option to Email Syntax:

Then scroll down, toggle on the input options, and select the validation:

The image shows a configuration interface for a form field. On the right side, there is a vertical bar with colored segments: a small red segment at the top, a light blue segment, a yellow segment, another light blue segment, and a larger red segment at the bottom that extends horizontally to the right.

The main configuration area is divided into several sections:

- Field Alignment**: A toggle switch that is currently turned off.
- Make Field Required (optional)**: A toggle switch that is currently turned off.
- Show Help Text (optional)**: A toggle switch that is currently turned off. Below it, there is a text description: "Help Text is optional text below the field to provide extra guidance for filling it out."
- Input Options**: A section containing a green toggle switch that is turned on. This toggle is highlighted with a red rectangular box.
- VALIDATION**: A dropdown menu with the text "Choose an option" and a downward arrow. The dropdown is open, showing a list of options: "Choose an option" (highlighted in green), "Email Syntax" (highlighted in blue with a red arrow pointing to it), "Phone (10 Digits)", "Phone (11 Digits, USA +1)", "Phone (11 Digits, Global)", "Phone (EU)", and "Phone (8-15 Digits, International)".
- Copy Quiz Weight Logic From**: A section header at the bottom of the configuration area.

Be sure to set the field as required. Otherwise, the user will be able to submit without entering a value.
