

All and None of Above for Multi-Select Buttons

Last Modified on 06/24/2026 12:26 pm EDT

Digioh supports Multi-Select Buttons that act like checkboxes and are mapped to Custom Fields. These are button elements with action "Select Button" and when clicked the button highlight toggles on and off along with the field value being set and cleared respectively.

Sometimes you may want to implement a preset group of buttons that toggle on and off together. A typical example would be if you had an "All of the Above" and/or "None of the Above" buttons. To do this, you'll need the extension "Multi-Select All & None of Above Buttons". To install this, go to your profile menu and select Extensions, find it under "Button customization" in the list, and click Install.

Once installed, you can configure button (element) level metadata as follows:

- **select_option=groupName** - add to buttons that are to select and deselect together as a group
- **select_none=groupName** - add to one (or more) buttons that when clicked will **deselect** the *groupName* group
 - Any buttons using this metadata will also need **select_options : true**
- **select_all=groupName** - add to one (or more) buttons that when clicked will **select** the *groupName* group
 - Any buttons using this metadata will also need **select_options : true**
- **select_only=groupName** - add to all buttons on a page when **only one button will be selected** in the *groupName* group

Here, *groupName* can be whatever you want, but it needs to be consistent for buttons that work together. You must use either `select_none`, `select_all`, or both, for `select_option` to have any effect. You can have any number of button groups on any number page, but group names do not work across different pages.

Key Value

select_option pumping

For select_only, no select_option is necessary. Each button on the page will need to have the metadata key and value added to it as shown below:

Choose Pages Choose Elements Set

Metadata

Key Value

select_only pumping

This extension also supports preselecting a button. You can configure button (element) level metadata for preselecting a button:

- select_autoselect=true

Button Metadata

Button Metadata allows you to assign key-value pairs to define additional properties or context for buttons.

KEY VALUE

select_autoselect true

There may be cases where the number of select buttons selected by the user needs to be limited. In order to do this, please use the [Selected Button Count Validation App](#).

Deselecting a Multi-Select Group When a Text Field Has a Value

In some use cases, you may want a **text field** to automatically **clear** any selected buttons in a multi-select button group. This allows you to offer an "Other (please specify)" free-text option that behaves like a mutually-exclusive input.

How It Works

When the visitor types into the configured text field:

- All buttons belonging to the specified `select_option` group will immediately be deselected.
- The text field value will then be used for downstream submission or mapping (e.g., to a custom field).

How to Configure It

1. Identify the group name used by your `select_only` or `select_option` metadata for the button group.
2. Open the metadata for the text field that should clear the group.
3. Add the following metadata key/value pair:
`clear_select_only : groupName`

Where `GroupName` must match the exact group name used by the rest of the multi-select buttons.

For example:

Label Text

ENTER LABEL TEXT (or the text above the input field)

ENTER LABEL SUBTEXT (or the text above the input field)

Field Alignment

Make Field Required (optional)

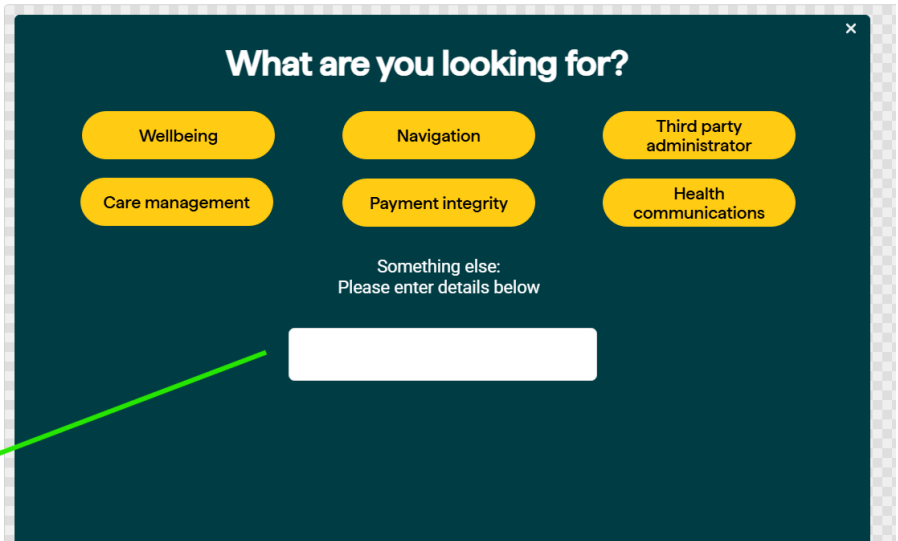

Show Help Text (optional)
Help Text is optional text below the field to provide extra guidance for filling it out.

Input Options

Set Ghost Text or Default Value (optional)

Field Metadata

KEY	VALUE
clear_select_only	looking_for
