Validate Zip Code Input

Last Modified on 07/23/2026 1:23 pm EDT

If you are collecting US Zip Code in Digioh forms, you may want to enforce input validation that it is a 5 digit number.

This can be done with Digioh Extension: **US zip code validation**. To add this app to your account, follow these steps:

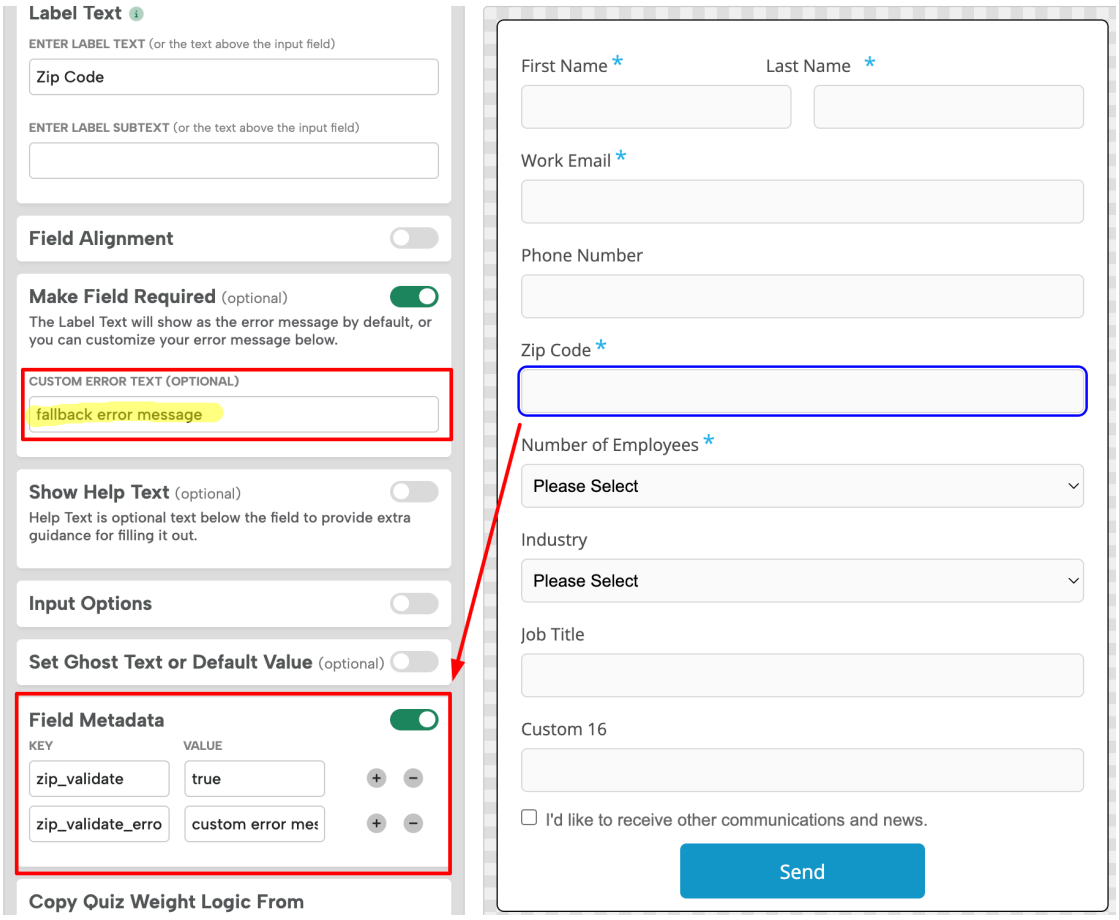

1) Click on your Profile name (top-right) > Extensions.

2) Expand the **Data Validation** category & select the **Install** button for our **US Zip Code Validation** extension:

Then, you can configure validation for the specific custom field you are using for Zip:

This app works in addition to Digioh native validation. The app will honor the field "Required" setting and not try to validate an empty field, and if you enter something for "Error Text" (in green) then the app will use that.

If you want a different error message for required, e.g. "Zip Code is Required", vs. invalid e.g. "Please enter a valid US zip code.", then you can also configure metadata **zip_validate_error**.

- **zip_validate=true**: enable the extension for this field
- **zip_validate_error=*error text***: show this error on validation failure
- **Native Error Text (Custom Error Text box)**: app will use this error if no zip_validate_error metadata is configured
- "Please enter a valid US zip code.": default error if neither Error Text or zip_validate_error is configured"

Any non-empty value activates validation

The **zip_validate** key is evaluated for presence, not for a specific value. Any non-empty string — including "false" — activates zip validation. To disable validation on a field, **remove the zip_validate metadata attribute entirely**.

Metadata reference

Metadata Key	Level	Value	Description
`zip_validate`	Element	true	Activates zip code validation on this text input field.
`zip_validate_error`	Element	Your message	Custom error message shown when validation fails. Overrides the field's Error Text setting and the default message.
