

Validate Zip Code Input

Last Modified on 06/24/2026 12:40 pm EDT

This functionality is from a [Digioh Extension](#).

If you are collecting US Zip Code in Digioh forms, you may want to enforce input validation that it is a 5 digit number. If so, install Extension: "US zip code validation", from the profile menu top right, "Extensions".

Then, you can configure validation for the specific custom field you are using for Zip:

The image shows the configuration interface for the 'Zip Validation' extension on the left and a preview of the validation modal on the right.

Configuration Interface:

- Error Text:** A text input field containing 'general error message'.
- Validation:** A dropdown menu with 'Choose an option' selected.
- Form Merge Tags:** A dropdown menu with 'Choose an option' selected.
- Field Metadata:** A table with two rows:

Key	Value	
zip_validate	true	+ -
zip_validate_errc	custom zip error	+ -

Zip Validation Modal:

The modal is titled 'Zip Validation' and contains a text input field labeled 'Enter Zip Code' and a blue button labeled 'Check it'.

This app works in addition to Digioh native validation. The app will honor the field "Required" setting and not try to validate an empty field, and if you enter something for "Error Text" (in green) then the app will use that.

If you want a different error message for required, e.g. "Zip Code is Required", vs. invalid e.g. "Please enter a 5 digit zip code", then you can also configure metadata zip_validate_error.

- zip_validate=true: enable the app for this field
- zip_validate_error=error text: show this error on validation failure
- Error Text: app will use this error if no zip_validate_error
- "Please Enter a Valid 5 digit Zip Code": default error if neither Error Text or zip_validate_error is configured
