Validate Numeric Values in Form Input

Last Modified on 06/24/2026 12:34 pm EDT

If you want to require that an input field be a number, install the extension **Validate Numeric Ranges**, and Publish.

Then, configure field-level metadata on the appropriate input field (must be text input).

On form submission, this will validate that input is numeric for any fields with metadata commands:

- **num_validate** : *true* OR *x-y*
- **num_validate_error** : optional error message shown if invalid
- **num_max** : max number of characters allowed
- **num_max_error** : Error displayed if the number of characters exceed the max.
- **num_min** : min number of characters required
- **num_min_error** : Error displayed if the number of characters is less than the min

If any number is valid, just set num_validate to true. Otherwise enter a range, like 0-100. Note that the range is inclusive, so 0 and 100 are both valid when 0-100, and 101 is invalid.
