# Digioh native's phone and email validation

Last Modified on 06/24/2026 5:29 pm EDT

This guide explains what Digioh validates out-of-the-box, how errors appear, and where to configure everything in the editor.

## What Digioh validates by default

- **Email (standard field):** Digioh automatically checks for a normal email pattern and blocks submissions that don't match.
- **Phone (standard field):** Basic phone checks are enabled by default (US format). You can switch to European formatting, enable a country-code selector (full list or a restricted list), and set separate **display** vs **submit** formats.

## Phone validation options (built-in)

You can apply these to the **Phone** field or to a **Custom Text Box** via Input Options:

- Phone (10 Digits)
- Phone (11 Digits, USA +1)
- Phone (11 Digits, Global)
- Phone (EU)
- Phone (8–15 Digits, International)

## Email validation on custom fields

Need an email check on a custom text input instead of the standard Email field? Enable **Input Options → Email Syntax** on that custom field.

## Error messages & where they appear

- Turn **Make Field Required** on any field to force entry and set a **custom error text** for invalid/missing values.
- Choose where errors render: **Top**, **Inline**, or **Top and Inline** (Form → Inputs → Error Message Position).

## Where to configure (Editor path)

1. Open your box → **Form** tab.

2. Under **Fields**, select **Email** or **Phone** to adjust validation and formatting (country code, display vs submit).

3. For **custom text fields**, use **Input Options** to apply email or phone rules as needed.

## Helpful add-ons (optional)

- **Catch common email typos** (e.g., `gmial.com`): Install the "Prevent Common Email Typos" extension and enable it on the email field via metadata.
- **Improve error bubble readability** (wrapping/positioning/height): Install App #62 "Improved Error Bubbles."
- **Real-time email verification** (deliverability): Integrate a validator such as BriteVerify, Kickbox, or NeverBounce. (BriteVerify can block submit and show an alert if the check fails.)

---

### Quick setup checklist

- Email: use the standard **Email** field (native syntax check) or apply **Email Syntax** to a custom field.
- Phone: pick the right **Phone** option (US/EU/Global), set **country code** behavior, and configure **display vs submit** formats.
- Errors: set **Required** + **custom error text**, and choose **Top/Inline** error placement.
