Swipe Pages Extension

Last Modified on 06/24/2026 4:17 pm EDT

What It Does

The Swipe Pages extension adds mobile swipe navigation to your Digioh forms. Users can swipe left to move to the next page or swipe right to go back to the previous page, just like a native mobile app.

Features

- **Swipe Left**: Moves to next page (submits form data automatically)
- **Swipe Right**: Goes back to previous page
- **Works on Mobile**: Touch gestures for phones and tablets
- **No Setup Required**: Works automatically with your existing pages
- **Form Handling**: Automatically submits forms when moving forward

How to Use

For Your Users

- **Swipe left** to move to the next page
- **Swipe right** to go back to the previous page
- Works on any mobile device or tablet

Just install the extension and swipe will be supported.

What Happens

When Users Swipe Left

- Form data is automatically saved
- User moves to the next page
- If on the last page, form is submitted

When Users Swipe Right

- User goes back to the previous page
- No data is lost
- If on the first page, nothing happens

Page Flow Example

```
Page 1 → Page 2 → Page 3 → Thank You
```

- **Swipe left** on Page 1 → (checks data by submitting) and goes to Page 2
- **Swipe left** on Page 2 → (checks data by submitting) and goes to Page 3
- **Swipe left** on Page 3 → submits form, shows Thank You

- **Swipe right** on Page 2 → goes back to Page 1
- **Swipe right** on Page 3 → goes back to Page 2

Troubleshooting

Swipe Not Working

- Make sure you're testing on a mobile device or using mobile emulation in browser dev tools
- The extension only works with touch gestures

Form Not Submitting

- Check that your form validation is working correctly
- Ensure all required fields are filled out

Pages Not Changing

- Verify that your pages exist in your campaign configuration
- Check that page names follow standard conventions (main, ep1, ep2, thx)

Limitations

- Only works on touch-enabled devices (mobile phones, tablets)
- Requires forms to be properly configured
- Works best with standard page naming (main, ep1, ep2, thx)
